Uses text analysis and speech synthesis technologies to accurately read text aloud. It is designed to allow people to get to the point faster with ease. Download the demo version or purchase the full version for immediate access to the world's best text-to-speech software. Whether your web site is intended for only online or offline use, the text to speech technology is one of the most useful features that can be added to the site. Also, knowing a little bit about how text to speech works is helpful in understanding the technology itself. Here are a few questions that should help to clear up any confusion you might have. 1. What is text to speech? Text to speech is a speech synthesis software that reads text aloud. It is very much like a voice recording software in that you can record yourself reading a document, business, or website. However, the difference is that you can choose the content of what you're reading. This means that you can read out the text as if you were reading it out loud to yourself. It is the same idea as what happens when you read a book or an article in print. 2. How does text to speech work? When you use text to speech software, you access it by pressing a button or linking to an online link. It will open up, either in a document or website format, and a series of text will be displayed. This text will be read aloud in an automated way. You can

---

choose to read it out loud, have it read as quickly as possible, or have it read at your own pace. You can also choose to have it read slowly or slowly in a male voice or female voice. One of the best uses of text to speech is when you're reading something and need to quickly be able to get to the point. When this happens, having the text read aloud is a great way to speed up your reading. For example, if you're reading an email or a business report, a text to speech software can help you to get to the point faster. It is perfect for reading out a newspaper article, an email, or even a line or two from a book. 3. How does text to speech work? The way that text to speech works is fairly simple. The software understands the content of the text that you are reading. It then uses the different elements of the text to find the right pronunciation for it. Once the text is read, you can either listen to it as it's being 82157476af
